Government Executive Summary

Predictive Forecasting of Care Load & Placement Demand

1. Executive Overview

The analysis covers 720 valid historical observations from 2023-01-12 to 2025-12-21. The latest recorded HHS care load is 2,484.00. The historical average is 6,061.27, while the observed range is 1,972.00 to 11,516.00. The project contains 22 forecast-related output files, 10 risk-related files, 8 scenario-related files, and 15 uncertainty-related files.

2. Historical Care Demand

Historical demand is summarized using observed HHS care-load records. The report distinguishes observed values from estimates. Missing reporting dates are not interpreted as zero demand.

3. Forecast Horizons

The project evaluates 1-day, 7-day, 14-day, and 30-day forecast horizons. The detected forecast files and horizon metadata are presented in the evidence tables. A horizon is not claimed as validated unless supported by an output file.

4. Forecast Accuracy

Forecast accuracy is reported only where output files contain identifiable actual and predicted observations. MAE, RMSE, MAPE, sMAPE, and R-squared are calculated from matching observations. These metrics should be interpreted in the context of the validation and test periods.

5. Surge Warnings

Surge warnings should be interpreted using the project's generated risk and forecast outputs. A warning threshold must be supported by the project's documented assumptions; no threshold is invented in this report.

6. Capacity Breach Risks

Capacity breach risks are based on available capacity, breach probability, and operational resource-pressure outputs. Where capacity thresholds or probabilities are unavailable, the report identifies the evidence gap instead of asserting a breach.

7. Scenario Comparison

Scenario comparisons are presented from the generated scenario outputs. Scenario assumptions should be reviewed before using scenario projections for policy or resource allocation decisions.

8. Operational Implications

Forecasts can support staffing, placement planning, resource readiness, monitoring frequency, and contingency preparation. Forecasts are decision-support evidence and do not replace operational verification or statutory decision-making.

9. Government Recommendations

Maintain regular monitoring of observed care load; review short- and medium-term forecasts together; define and document capacity thresholds; prepare escalation procedures for credible surge signals; compare scenario assumptions before allocating resources; and update forecasts as new observations become available.

10. Limitations and Uncertainty

Forecasts are subject to historical data coverage, reporting irregularity, model error, structural changes, and uncertainty in scenario assumptions. Missing dates are not treated as zero. Prediction intervals and scenario ranges should be considered when interpreting point forecasts. Forecasts should not be treated as guarantees of future demand.

Historical Demand Indicators

Indicator	Value
First observed date	2023-01-12
Last observed date	2025-12-21
Number of valid observations	720
Average children in HHS care	6061.275
Median children in HHS care	6406.5
Minimum observed care load	1972
Maximum observed care load	11516
Latest observed care load	2484
Standard deviation	2833.0701088001565
First-to-last change	-4082
